# ETL Pipeline for Sales Data Processing using Apache Airflow & Docker

## Objective:

The objective of this project is to design and implement an automated ETL pipeline to process sales order data. The system extracts raw CSV data, applies cleaning and transformation rules, and loads processed data for analytics.

## Dataset Description:

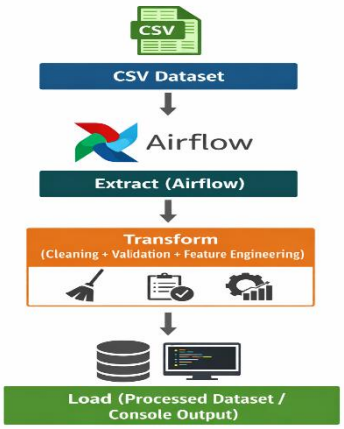
- Dataset: Sales Order Data
- Format: CSV
- Fields include:
    - Order ID
    - Date
    - Customer ID
    - Product
    - Quantity
    - Unit Price
    - Total Price
    - Profit
    - Discount
    - Payment Method
    - Order Status

The dataset contains structured transactional sales information.

## Tools & Technologies:

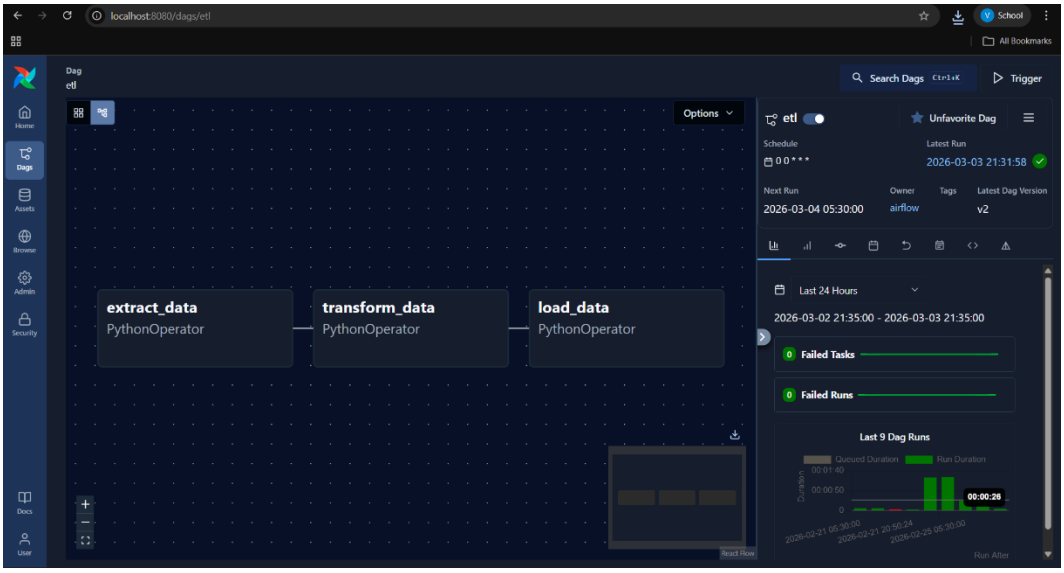
- Python (pandas)
- Docker
- Apache Airflow

## System Architecture:



## Initial DAG Design

The DAG consists of three tasks:

- extract_data
- transform_data
- load_data


Tasks are connected sequentially using Airflow dependencies.
